

OpenTAMS

TAMSNet

TAMSNet uses a Web Server to produce Browser forms with similar functions to TAMS.

Web Enabled - Remote users can get asset information via the WAN and Internet; Business colleagues can access TAMS asset information via the LAN and Intranet. LAN/Intranet access is generally faster than WAN/Internet access.

TAMSNet will allow for 2-way flow of information with the TAMS database, although it is only suited for light data entry functions e.g submitting a work request.

Enhanced work request / works management system.

TAMSMap

Enhanced GIS functionality. Ability to produce 'measles maps' showing, for example, asset condition, and to produce map based reports

TAMS

Full functionality, oriented towards the 'high end' asset managers who control the asset information and plan the work. More suited to high volume data entry and data querying.

Other Systems

2-way sharing of common data between TAMS and other corporate databases and applications. e.g. TAMS <-> Munsys (Open Spatial)
